

Jérôme Velociter

Freelance Product Engineer & Tech Lead

jerome@velociter.fr · www.jvelo.at · linkedin.com/in/jvelociter · github.com/jvelo

Product engineer and tech lead with 20 years of experience building web products and industrial software, including 10 years as a founder. I work alongside startup teams from early conversations onward, combining product judgment with hands-on engineering. I build and evolve software in TypeScript, Python, Java and Go, across cloud and edge infrastructure.

Toulouse, France · Open to full-time or fractional engagements

Remote or hybrid · Available for regular travel to Paris, London and Amsterdam

EXPERIENCE

2026 – present

Freelance Product Engineer & Tech Lead

Hands-on product engineering, technical leadership and team coaching for startup teams. I work as an individual contributor, hands-on manager or fractional CTO, with a particular interest in AI-native products and bringing AI capabilities into existing software.

2021 – 2026

Co-founder — Software, Product & Marketing · Orius · Toulouse, FR

Botanical research and production for cosmetics, nutrition and pharmaceuticals. Selected for France 2030 funding.

- Built BiomeOS from scratch across chamber automation, IT/OT monitoring, cloud and data infrastructure, then led the team running it across dozens of units in three time zones. Its offline-first architecture keeps each site operating through connectivity loss.
- Built the control and data software for two projects with CNES, the French space agency: prototype greenhouses for lunar and Martian habitats, and Gravidlab, a gravity simulator for plant biology.
- Set BiomeOS's product direction and built it to fit how researchers, growers and operators worked, from experimental protocols to day-to-day production.
- Led marketing: brand identity, website and sales collateral.
- Co-led a €4M funding round, owning the investment narrative and investor materials.

2016 – 2021

Director of Software Engineering · Agricoool · Paris, FR

2018 – 2021

- Grew the engineering team from one engineer to eight, across embedded software, microservices, full-stack, DevOps and data science.
- Led the team that built and ran the platform used across several dozen container farms in France and the UAE. It served growers, operations and sales, spanning edge and cloud infrastructure, data and analytics, back-office and mobile apps.
- Owned delivery of the rewrite from a Kotlin monolith to Go microservices as the farm architecture evolved from standalone containers to multiple growing environments with shared utilities. Coordinated the team, reviewed designs and code, coached engineers, and kept software aligned with the hardware construction calendar so it never delayed a planting.

Lead Software Engineer

2016 – 2018

- Owned the first generations of the proprietary farming software, from industrial IoT automation to agronomic domain modelling.
- Delivered remote crop management for year-round, commercial-scale indoor strawberry production, including a pilot farm in Dubai managed remotely over LTE.

2011 – 2016

Co-founder & Technical Director · 46cl · Lyon, FR

- Co-founded a web, mobile and UX agency and ran it for six years with a team of developers and designers, for clients from communications agencies to corporations.
- Created and led development of Mayocat Shop, an open source multi-tenant commerce platform on the JVM spanning storefronts, merchant administration, payments and content management. Production sites still run on it 12+ years later.

2007 – 2011

Software Engineer · XWiki · Paris, FR

- Core committer on the XWiki open source platform, from back-end services to user-facing features, including the Bepin editor integration and Markdown rendering support.
- Bootstrapped the Iași office in Romania on site over 18 months: hired, trained and managed its development team.
- Led customer and partner projects from pre-sales to delivery. Mentor for Google Summer of Code in 2008.

2005 – 2006

Software Developer Intern · Frog Navigation Systems (now Oceaneering) · Utrecht, NL

Black-box QA suite in Python for the AGVs' embedded computers, log mining for fault patterns, and CORBA services in Java.

PROJECTS

2025 – present

Typebar

Canvas-native rich-text engine with its own layout, text measurement, IME input and undo/redo, built for consistent performance on large documents. TypeScript with zero runtime dependencies. Beta.

2025 – present

Savannah

Desktop writing app built on Typebar, with a quiet interface, a local document library, and AI features designed to support rather than replace the writer.

2026 – present

Tapemark

Designed and built an open source SQLite administration toolkit with an embeddable web UI and a CLI, running on Node.js and Cloudflare D1 through a framework-independent core.

PUBLICATIONS

Development of a Modular and Deployable Plant Production System for Lunar and Martian Habitats

Co-author · International Conference on Environmental Systems, 2026 · doi.org/10.32865/2346/108859

Gravilab: An Advanced Random Positioning Machine for Arbitrary Gravity Simulation

Co-author · International Conference on Environmental Systems, 2026 · doi.org/10.32865/2346/108860

SKILLS

Programming	TypeScript, Python, Java, Go, Kotlin
Frontend	React, Lit, Web APIs, canvas
Backend	APIs, GraphQL, PostgreSQL, microservices
Architecture	Systems design, library and framework design
Cloud & infra	AWS, Docker, Terraform, CI/CD, observability
Industrial	Embedded Linux, IoT automation, industrial protocols
Product	Discovery, UX, product design
Leadership	Hiring, mentoring, team & stakeholder management

EDUCATION & LANGUAGES

IMT Nord Europe, engineering degree (MSc), 2007 · French, native · English, fluent
