

Jérôme Velociter

Freelance Product Engineer & Tech Lead

jerome@velociter.fr · www.jvelo.at · linkedin.com/in/jvelociter · github.com/jvelo

Product engineer and tech lead with 20 years of experience, including a decade as a founder. I work with startup teams to build, improve and operate software, combining hands-on development with product judgment and technical leadership. I've built web products and industrial systems, and grown an engineering team from one to eight.

Toulouse, France · Available for full-time or part-time freelance engagements

Remote or hybrid · Regular travel to Paris, London and Amsterdam

EXPERIENCE

2026 – present

Freelance Product Engineer & Tech Lead

Available for hands-on product engineering, technical leadership and fractional CTO engagements with startup teams.

2021 – 2026

Co-founder — Software, Product & Marketing · Orius · Toulouse, FR

Botanical research and production for cosmetics, nutrition and pharmaceuticals. Selected for France 2030 funding.

- Built BiomeOS to run growth chambers across dozens of units in three time zones, and led two engineers maintaining field systems and evolving the platform. Its offline-first architecture keeps sites running through connectivity loss and syncs data to the cloud.
- Enabled researchers to independently configure experiments, run them and perform statistical analysis on the resulting data, automating equipment configuration and data processing.
- Built control and data software for two CNES projects: prototype greenhouses for lunar and Martian habitats, and GraviLab, a gravity simulator for plant biology.
- Co-led a €4M funding round, owning the investment narrative and investor materials, and led company marketing across brand, website and sales collateral.

2016 – 2021

Director of Software Engineering · Agricool · Paris, FR

2018 – 2021

- Grew the engineering team from one engineer to eight, across embedded software, backend services, full-stack applications, DevOps and data science.
- Led development and operation of the software platform for several dozen container farms in France and the UAE, spanning equipment control, data analytics, and back-office and mobile applications for growers, operations and sales.
- Led the software platform's evolution from standalone growth chambers to farms with shared infrastructure, replacing a Kotlin monolith with Go services and aligning software delivery with the hardware rollout.

Lead Software Engineer

2016 – 2018

- Designed and built the first versions of Agricool's farming software, from industrial IoT automation to agronomic modelling.
- Delivered remote crop management for year-round commercial indoor strawberry production, including a pilot farm in Dubai managed remotely over LTE.

2011 – 2016

Co-founder & Technical Director · 46cl · Lyon, FR

- Co-founded a web, mobile and UX agency and ran it for six years with a team of developers and designers, for clients from communications agencies to corporations.
- Created and led development of **Mayocat Shop**, an open source multi-tenant commerce platform on the JVM spanning storefronts, merchant administration, payments and content management. Production sites still run on it 12+ years later.

2007 – 2011

Software Engineer · XWiki · Paris, FR

- Core committer on the XWiki open source platform, contributing across back-end services and user-facing features.
- Bootstrapped the Iași office in Romania on site over 18 months: hired, trained and managed its development team.
- Led customer and partner projects from pre-sales to delivery. Mentor for Google Summer of Code in 2008.

2005 – 2006

Software Developer Intern · Frog Navigation Systems (now Oceaneering) · Utrecht, NL

Built Python QA tooling for AGV embedded computers and developed Java services.

PROJECTS

2025 – present

Typebar

Canvas-native rich-text engine with custom layout, supporting multi-million-word documents and optional offline-first sync. TypeScript core with zero runtime dependencies.

2025 – present

Savannah

Desktop app for long-form writing powered by Typebar, with focus modes, an autosaving local library, full-text search and optional AI-assisted document discussion. Private alpha.

2026 – present

Tapemark

Designed and built an open source toolkit that turns SQLite databases into extensible admin interfaces, with automatic schema discovery, relationship-aware editing and custom actions. Embeddable or CLI-driven, running on Node.js and Cloudflare D1.

PUBLICATIONS

Development of a Modular and Deployable Plant Production System for Lunar and Martian Habitats

Co-author · International Conference on Environmental Systems, 2026 · doi.org/10.32865/2346/108859

Gravilab: An Advanced Random Positioning Machine for Arbitrary Gravity Simulation

Co-author · International Conference on Environmental Systems, 2026 · doi.org/10.32865/2346/108860

SKILLS

Programming	TypeScript, Python, Java, Go, Kotlin
Applications	React, Lit, Electron, progressive web apps (PWAs)
Backend & data	RESTful APIs, GraphQL, PostgreSQL, SQLite
Architecture	Systems design, library and framework design
Cloud & infra	AWS, Docker, Terraform, CI/CD, observability
Industrial	Embedded Linux, IoT automation, industrial protocols, touchscreen interfaces
Product	Discovery, UX, product design

EDUCATION & LANGUAGES

IMT Nord Europe, engineering degree (MSc), 2007 · French, native · English, fluent
